

## METHOD FOR DELIVERING STOCK QUOTES IN REAL-TIME

### BACKGROUND OF THE INVENTION

N.E.

#### 1. Technical Field

The present invention relates to data processing in general, and in particular to a method for disseminating financial information in real-time. Still more particularly, the present invention relates to a method for delivering stock quotes in real-time.

#### 2. Description of the Prior Art

It has long been recognized that accesses to timely information regarding current conditions in various commodities and financial markets are essential to profitable trading and investment. Many complex investment strategies require precise and careful timing of specific transactions in response to fluctuating market conditions. This is particularly true in today's fast-moving markets where the ability to respond quickly to changing market conditions may mean the difference between substantial profits or devastating losses. Many investors rely heavily on real-time stock quotes when implementing their investment strategies, and most of those investors get their real-time stock quotes from a brokerage company. Thus, a successful brokerage company must be able to provide stock quotes as accurately and efficiently as possible.

Stock quotes are currently provided by stock exchanges, such as New York Stock Exchange, NASDAQ, etc., to a field vender such as Bloomberg or Comstock. After parsing the stock quote information received from the stock exchanges, the field vender then sends the stock quote information to a quote server at a rate of about 1,000 to 2,000 packets per second. The quote server is typically located at a regional brokerage office such as TradeCast or Merrill Lynch. The quote server has a database and keeps track of the history

of each specific stock quote. If the stock quote is not in the database, the quote server adds the stock quote to the database. If the stock quote is already in the database, then the quote server updates the database. Next, the quote server checks to see if a registered user has requested that particular stock quote. Most brokerage companies use a subscription based system. If one workstation or trader registers a particular stock quote, then every time the tick or quote comes in, the trader gets an update on that stock quote. If numerous customers are requesting for stock quotes at the same time, then the quote server will take some time to send the requested stock quotes to all the requesting customers. However, if the quote server spends more time delivering stock quotes, then the quote server must spend less time getting stock quotes. Thus, when the above-mentioned response time to the requesting customers takes too long, the quote server may miss some of the stock quotes sent by the field vender. As a result, investors may not have the most current stock quote information needed to make intelligent trading decisions.

Consequently, it would be desirable to provide an improved method to deliver stock quotes to investors in real-time.

## SUMMARY OF THE INVENTION

5 In accordance with a preferred embodiment of the present invention, stock  
quote information from a provider are received by a quote server. In response to a stock quote  
request from a user to a contact server, the contact server requests the stock quote request from  
the quote server. The quote server then sends a respective stock quote according to the stock  
quote request to the contact server. In turn, the contact server disseminates the stock quote to  
the user. By having to send the requested stock quote information only once, the quote server  
is able to spend more time in receiving stock quote information and less time in distributing  
10 the stock quote information. A contact server enables the system to serve 1,000 - 2,000 people  
per combination of the quote and contact server.

All objects, features, and advantages of the present invention will become  
apparent in the following detailed written description.

### BRIEF DESCRIPTION OF THE DRAWINGS

5 The invention itself, as well as a preferred mode of use, further objects, and advantages thereof, will best be understood by reference to the following detailed description of an illustrative embodiment when read in conjunction with the accompanying drawings, wherein:

Figure 1 is a block diagram of a stock quoting system according to the prior art;

10 Figure 2 is a block diagram of a stock quoting system in accordance with a preferred embodiment of the present invention; and

15 Figure 3 is a flow chart of a method for delivering stock quotes in real-time utilizing the stock quoting system in Figure 2, in accordance with a preferred embodiment of the present invention.

## DETAILED DESCRIPTION OF A PREFERRED EMBODIMENT

Referring now to the drawings and in particular to Figure 1, there is shown a block diagram of a stock quoting system according to the prior art. As shown, a stock quoting system 10 includes a quote server 13 and a database 14. Generally, stock quotes are sent from a source of stock quote 11 to a field vendor 12 and then to quote server 13. Source of stock quote 11 are typically stock exchanges, such as New York Stock Exchange, NASDAQ, etc. Field vendor 12 are trading vendors such as Bloomberg or Comstock. Stock traders can request stock quotes from quote server via trading stations 15a-15n. In response to a stock quote request, quote server 13 would send a stock quote to a corresponding one or more of trading stations 15a-15n. Because stock quoting system 10 is a closed system, quote server 13 has to finish sending stock quotes to trading stations 15a-15n before quote server 13 can perform other important functions such as reading data from field vendor 12. In other words, if quote server 13 spends more time delivering stock quotes, then quote server 13 has to spend less time obtaining stock quotes. As a result, quote server 13 may miss a stock quote (or data packet) from field vendor 12. Because quote server 13 does not have the most current stock quote, database 14 could not be updated, and a trader would not have the most current stock quote information needed to make intelligent trading decisions.

With reference now to Figure 2, there is shown a block diagram of a stock quoting system in accordance with a preferred embodiment of the present invention. As shown, a stock quoting system 20 includes a quote server 23, a database 24 and a contact server 26. Stock quotes are sent from a source of stock quote 21 to a field vendor 22 and then to quote server 23. Source of stock quote 21 can be any exchange that generates stock quotes similar to source of stock quote 11 depicted in Figure 1. Field vendor 22 parses the information and multiplexes it to quote server 23 at a rate of approximately 1,000 - 2,000 stock quotes (or packets) per second. Quote server 23 can be any type of server capable of receiving and transmitting information, and is located in a regional brokerage office such as TradeCast

or Merrill Lynch. Quote server 23 is coupled to database 24 that keeps track of the history of each specific stock quote. If a quote for a particular stock is not in database 24, quote server 23 will add the missing stock quote to database 24. If the stock quote is already in database 24, quote server 23 will update database 24 with the latest information. Stock traders can request stock quotes from contact server 26 via trading stations 25a-25n. Contact server 26 may be, for example, a workstation, a mid-range computer or a mainframe computer. In addition, contact server 26 may be coupled to a network such as a local-area network (LAN) or a wide-area network (WAN). In response to a stock quote request, contact server 26 would send a stock quote to a corresponding one or more of trading stations 25a-25n.

Referring now to Figure 3, there is illustrated a flow chart of a method for delivering stock quotes in real-time utilizing stock quoting system 20, in accordance with a preferred embodiment of the present invention. After data has been received by a quote server, as shown in block 31, a determination is made by the quote server as to whether or not the received data is a valid packet, as depicted in block 32. If the received data is a valid packet, the received data will be stored in a database coupled to the quote server, as shown in block 33. Otherwise, the received data will be discarded or ignored. Then, the quote server checks to see if a contact server is requesting a particular stock quote, as shown in block 34. If the contact server is requesting a stock quote, the quote server sends the stock quote to the contact server, as depicted in block 35. The contact server may send the stock quote to all traders who have requested that particular stock quote. If no trader has made a stock quote request, then the contact server does not request any stock quote from the quote server.

As has been described, the present invention provides an improved method for delivering stock quotes in real-time. Because the quote server sends a stock quote to the contact server only when a stock quote request has been made from a trader via the contact server, the quote server is not burden with the responsibility of delivering stock quotes for each stock quote request. As such, the quote server can dedicate more processing for receiving new

stock quote information from a field vendor.

5 It is also important to note that although the present invention has been described in the context of a fully functional computer system, those skilled in the art will appreciate that the mechanisms of the present invention are capable of being distributed as a program product in a variety of forms, and that the present invention applies equally regardless of the particular type of signal bearing media utilized to actually carry out the distribution. Examples of signal bearing media include, without limitation, recordable type media such as floppy disks or CD ROMs and transmission type media such as analog or digital communi-  
10 cations links.

While the invention has been particularly shown and described with reference to a preferred embodiment, it will be understood by those skilled in the art that various changes in form and detail may be made therein without departing from the spirit and scope of the invention.
